InvoBridge Partner & Business Overview

NRS E-Invoicing Is Now a Board-Level Priority

The Merchant Buyer Solution (MBS) requires structured pre-clearance of invoices, with firm obligations and real consequences for delay.

MANDATE

Regulatory Mandate

Large taxpayers are already in scope. Medium and other VAT-registered businesses are being phased in through 2026 and 2027.

EXPOSURE

Penalty & Recovery Risk

Errors and delays can trigger fines, block VAT recovery and create findings at audit.

STRAIN

Operational Strain

Real-time validation, IRN/QR handling and status tracking quickly overwhelm manual or partial solutions.

Executive takeaway: e-invoicing readiness is now a compliance and operational risk that sits with finance leadership.

Who Needs to Comply, and When

NRS e-invoicing is being rolled out in phases. Exact dates are set by NRS and can change.

LARGE

Above ₦5 billion revenue / year

Already required to comply. Rollout started late 2025 and compliance monitoring is active.

MEDIUM

₦1 billion – ₦5 billion revenue / year

Being brought in during 2026. Onboarding and go-live are underway this year.

OTHER

Other VAT-registered, including small businesses

Expected to join by 2027 under the new tax law, becoming fully mandatory later.

Note: businesses should confirm their exact category and applicable dates with NRS or a qualified tax adviser.

One Platform, Three Ways to Get Compliant

Whatever your starting point, there is a straightforward path onto InvoBridge.

HAVE AN ERP

Keep It, and Connect It

SAP, Oracle or any accounting system connects to InvoBridge by API or file exchange. InvoBridge becomes the compliance and integration layer while your ERP stays the system of record.

NO ERP

No Problem

Raise, validate and submit invoices directly through the InvoBridge interface. No ERP implementation is required to get compliant.

NEED FULL ACCOUNTING

IntelliOps ERP

Infonomics' full ERP option incorporates InvoBridge alongside General Ledger, Accounts Payable, Accounts Receivable, Procurement and Purchase-to-Pay.

InvoBridge can stand alone for e-invoicing, integrate with an existing ERP, or form part of the broader IntelliOps ERP environment.

The Control Layer Between Your Business and NRS

InvoBridge sits between your finance systems and the NRS MBS platform, so compliance becomes part of the normal invoice process.

1 ERP-Agnostic

Works with your current systems via API, file exchange or native entry.

2 Control-First

Validation and approval happen before any regulatory submission.

3 Full Lifecycle

From capture through IRN/QR, status, retry and audit.

4 Proven Patterns

Built on reference patterns developed with NRS from the outset.

InvoBridge is an ERP-agnostic gateway developed by Infonomics Technology Services Limited. It handles validation, approval, compliant payload preparation, secure submission, response handling and ongoing monitoring, on behalf of businesses that need to meet NRS e-invoicing requirements.

The client's ERP or accounting system remains responsible for the organisation's underlying financial records. InvoBridge provides the e-invoicing and integration layer required to facilitate compliant electronic invoicing.

Terms You'll Hear

Plain-language explanations for finance, tax and business stakeholders.

NRS	Nigeria Revenue Service, the tax authority responsible for e-invoicing (previously known as FIRS).
MBS	Merchant Buyer Solution, the government platform that receives and clears e-invoices.
APP	Access Point Provider, an approved party such as Infonomics/InvoBridge that connects a business to NRS.
IRN	Invoice Reference Number, a unique identifier NRS assigns to each approved invoice.
QR Code	A scannable code added to an invoice once NRS approves it, allowing anyone to verify it is genuine.

Your Invoice Journey With InvoBridge

The user experiences one controlled business process. InvoBridge manages the compliance steps behind it.

Business outcome: one controlled journey from invoice creation to compliance confirmation, with a full audit trail.

Multiple Ways to Bring Invoices Into InvoBridge

The organisation can start with simple uploads and progress to full automation without changing the compliance layer.

1

Native

Create invoices directly in InvoBridge. Useful where users need a simple invoicing route.

2

ERP / Accounting

Receive invoice data from existing systems through prebuilt or custom connectors.

3

Excel Upload

Controlled bulk processing through the portal for spreadsheet-based teams.

4

Secure File Transfer

Scheduled or batch file exchange, practical for bulk processing.

5

API Integration

Real-time, system-to-system automation for high-volume environments.

One compliance platform, different entry points, so adoption fits your business rather than the other way around.

Security, Control & Audit Readiness

How InvoBridge protects invoice data and keeps Finance, Tax and Audit teams in control.

BEFORE SUBMISSION

Controlled Validation

Validation and approval steps mean only cleared invoices are sent. Incomplete or unauthorised invoices stay inside the organisation.

IN TRANSIT

Secure Exchange

Invoices move through an approved Gateway / Access Point route, using HTTPS/TLS encrypted communication to NRS.

THROUGHOUT

Full Audit Trail & Access Control

Every status change, approval and response is logged. Role-based access and per-entity credentials keep the right people acting on the right invoices.

Evidence is available for internal review or external audit at any point in the invoice lifecycle.

A Deployment Model That Fits Your Environment

Cloud or on-premise, InvoBridge is architected to scale with transaction volumes and business entities.

Cloud Deployment	On-Premise Deployment	Built to Scale
- Flexible, centrally monitored infrastructure - Faster scalability as volumes grow - Reduced dependence on client-owned hardware	- Infrastructure within the client's own environment - Greater control over server resources and network integration - Aligned to specific data or infrastructure policies	- Application and database services can be separated as volumes grow - Monitoring and recovery procedures suited to business continuity needs - Additional entities and transaction volumes accommodated over time

The final architecture is confirmed during technical assessment, based on the client's infrastructure and policies.

Proven in Nigeria, Built for NRS E-Invoicing

A decade of enterprise delivery, focused on control and shaped by direct experience with NRS.

DELIVERY

A Decade of Delivery

Over ten years deploying scalable, standards-based digital solutions to leading organisations across Nigeria.

EXPERTISE

There From Day One

Worked closely with NRS at the outset of the e-invoicing initiative, establishing reference patterns for validation, IRN/QR handling and resubmission.

CONTROL

Designed for Governance

Maker-checker workflows, immutable payload logging and comprehensive traceability are standard, not optional extras.

What the Organisation Gains

Compliance becomes part of the normal invoice process rather than a separate manual activity.

Lower Compliance Risk

Validate and control invoices before regulatory submission, avoiding rejections after the invoice has already reached the customer.

Faster Time-to-Compliance

Pre-built NRS connectors, schemas and validation rules support compliance in weeks, not months.

Operational Clarity

One point of control for status, exceptions and resubmissions keeps Finance and Tax ahead of the curve.

Stronger Governance

Approvals, immutable payload logs and processing history support audit and accountability.

Flexible Adoption

Start with uploads or native invoicing, and progress to full ERP integration without changing the compliance layer.

Smarter Cost Management

Reuse what already works and configure only where needed, avoiding expensive bespoke rebuilds.

From Kickoff to Ongoing Operations

We start by understanding how your business already works, then support you well beyond go-live.

Path to Deployment

- 1 Assess**
Invoice sources, process, controls and data readiness.
- 2 Configure**
Integration approach, validation rules and approval workflows.
- 3 Test**
End-to-end invoice and response scenarios with NRS.
- 4 Operate**
Go-live, monitoring, support and continuous reporting.

What Happens After Go-Live

- **Monitoring**
Dashboards show queued, sent, accepted, rejected and failed invoices.
- **Exception Handling**
Clear error information and guided retries for failed invoices.
- **Reporting & Evidence**
Exportable reports and full processing history for finance, tax and audit.
- **Ongoing Support**
Configuration updates, training refreshers and operational support.

No surprises, no disruption to the business you are already running.

What InvoBridge Is, and Is Not

Clear scope keeps expectations aligned across finance, tax and IT stakeholders.

InvoBridge Is

- ✓ An e-invoicing and integration platform
- ✓ A compliance and control layer between business systems and NRS
- ✓ Able to operate independently, integrate with an ERP, or sit within IntelliOps ERP

InvoBridge Is Not

- ✗ A replacement for a client's existing ERP or general ledger
- ✗ A financial reporting system, or a substitute for professional tax or accounting advice
- ✗ A guarantee of tax compliance; clients remain responsible for their overall tax and accounting obligations

Working With Infonomics

Flexible partnership models, with commercial terms confirmed for each engagement.

Partnership Models

- Referral partnerships
- Sales partnerships
- Technology and integration partnerships
- ERP partnerships
- Implementation partnerships
- Strategic business partnerships

Commercial Terms

Pricing is available on request, based on transaction volume, deployment model and integration scope.

Separately, the commercial team provides deployment pricing, subscription or licensing fees, implementation fees, support and maintenance fees, and applicable partner or referral commission structures.

Commercial and commission details are confirmed through the Infonomics Commercial Team.

A Practical Path Forward

Keep control of your invoicing and stay compliant with NRS, without forcing your organisation into a single source or operating model.

1

Assess

Invoice sources, process, controls and data

2

Configure

Integration, validation and approval rules

3

Test

End-to-end invoice and response scenarios

4

Operate

Go-live, monitoring, support and reporting

Next step: schedule a discovery conversation or readiness assessment.
