InvoBridge Alignment with NRS E-Invoicing Requirements

InvoBridge in one view

A single platform for businesses that need both operational invoicing and regulatory compliance.

1 CAPTURE

Create or Receive Invoices

Invoices can originate directly in InvoBridge or arrive from ERP, accounting systems, spreadsheets, files or APIs. The business can therefore adopt InvoBridge without replacing its existing systems.

2 CONTROL

Control Before Submission

Validation and approval workflows help ensure that invoices are complete, accurate and authorised before they are sent for regulatory processing.

3 COMPLY

Connect & Stay Informed

The platform prepares compliant invoice payloads, sends them through the InvoBridge Gateway / Access Point route, captures NRS responses and gives users visibility of every invoice status.

Business outcome: one controlled journey from invoice creation to compliance confirmation.

Fits around the way your business already works

InvoBridge can be introduced as an integration layer, a native invoicing platform, or a combination of both.

1 Integration-led

Keep your existing ERP/accounting process. InvoBridge receives invoice data, applies compliance controls and manages regulatory submission.

WHEN IT FITS BEST

Best for organisations with mature ERP environments.

2 Native invoicing

Users raise invoices directly in InvoBridge, follow review/approval steps, then submit to NRS.

WHEN IT FITS BEST

Best where a standard, controlled invoicing process is needed.

3 Hybrid

Use both approaches: some invoices arrive from enterprise systems while others are created directly or uploaded.

WHEN IT FITS BEST

Best for groups with multiple subsidiaries, systems or operating models.

The compliance layer remains consistent even when the invoice source changes.

What happens to an invoice?

A simple seven-step journey that turns business invoice data into a monitored compliance transaction.

The user sees one business process; InvoBridge manages the compliance steps behind it.

How InvoBridge aligns with NRS e-invoicing requirements

The NRS requirements can be understood in four practical business areas.

1. CAPTURE & CONTROL

- Required invoice information
- Validation of mandatory data
- Internal approval before dispatch

2. COMPLIANCE PREPARATION

- Invoice reference / IRN management
- QR code generation
- NRS-compatible payload generation

3. SECURE EXCHANGE

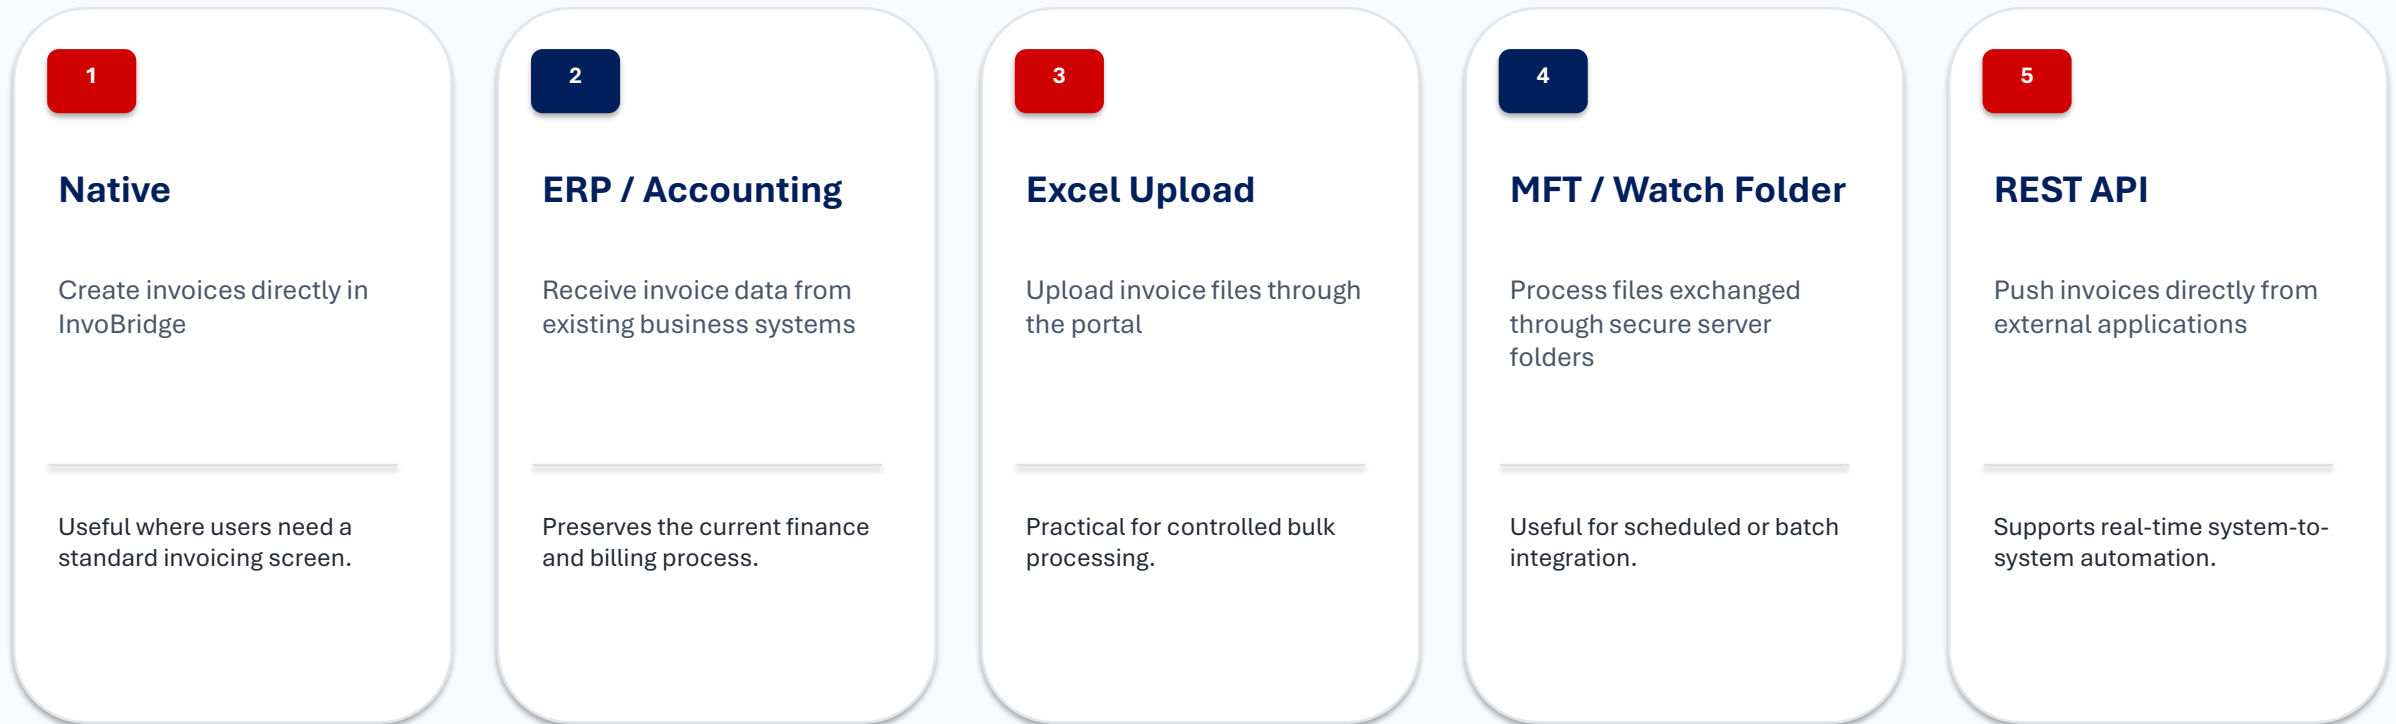

- Secure dispatch through Gateway / APP
- NRS success, rejection and error responses
- Retry and exception handling

4. GOVERNANCE & VISIBILITY

- Status monitoring and dashboards
- Audit trail and processing history
- Payment updates, reporting and reconciliation

Multiple ways to bring invoices into InvoBridge

The organisation can start with simple uploads and progress to full automation without changing the compliance process.

One compliance platform — different entry points.

Control the invoice before it leaves the organisation

InvoBridge helps separate invoice preparation from final regulatory submission.

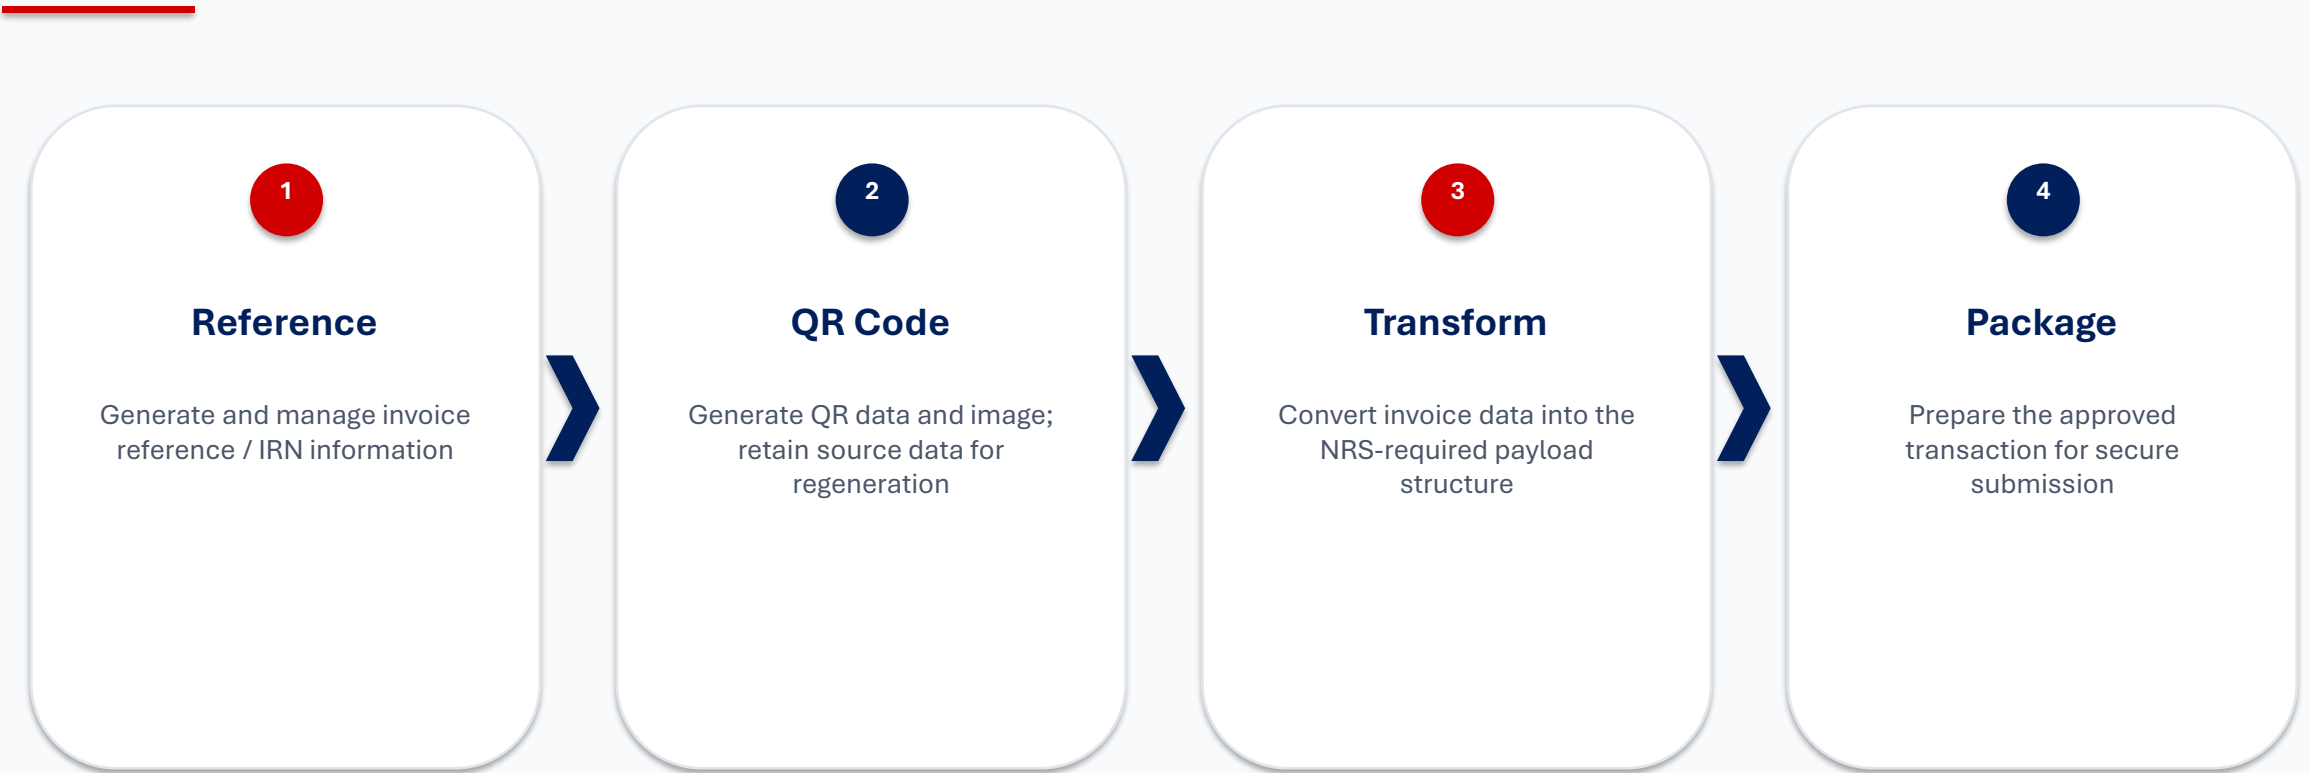

Why this matters to the business

- Prevents incomplete or unauthorised invoices from being submitted.
- Allows finance and tax controls to be embedded in the normal business process.
- Reduces avoidable rejection and rework after submission.
- Creates a visible approval trail for audit and governance.
- Supports configurable controls across different entities or invoice types.

Prepare a compliant invoice automatically

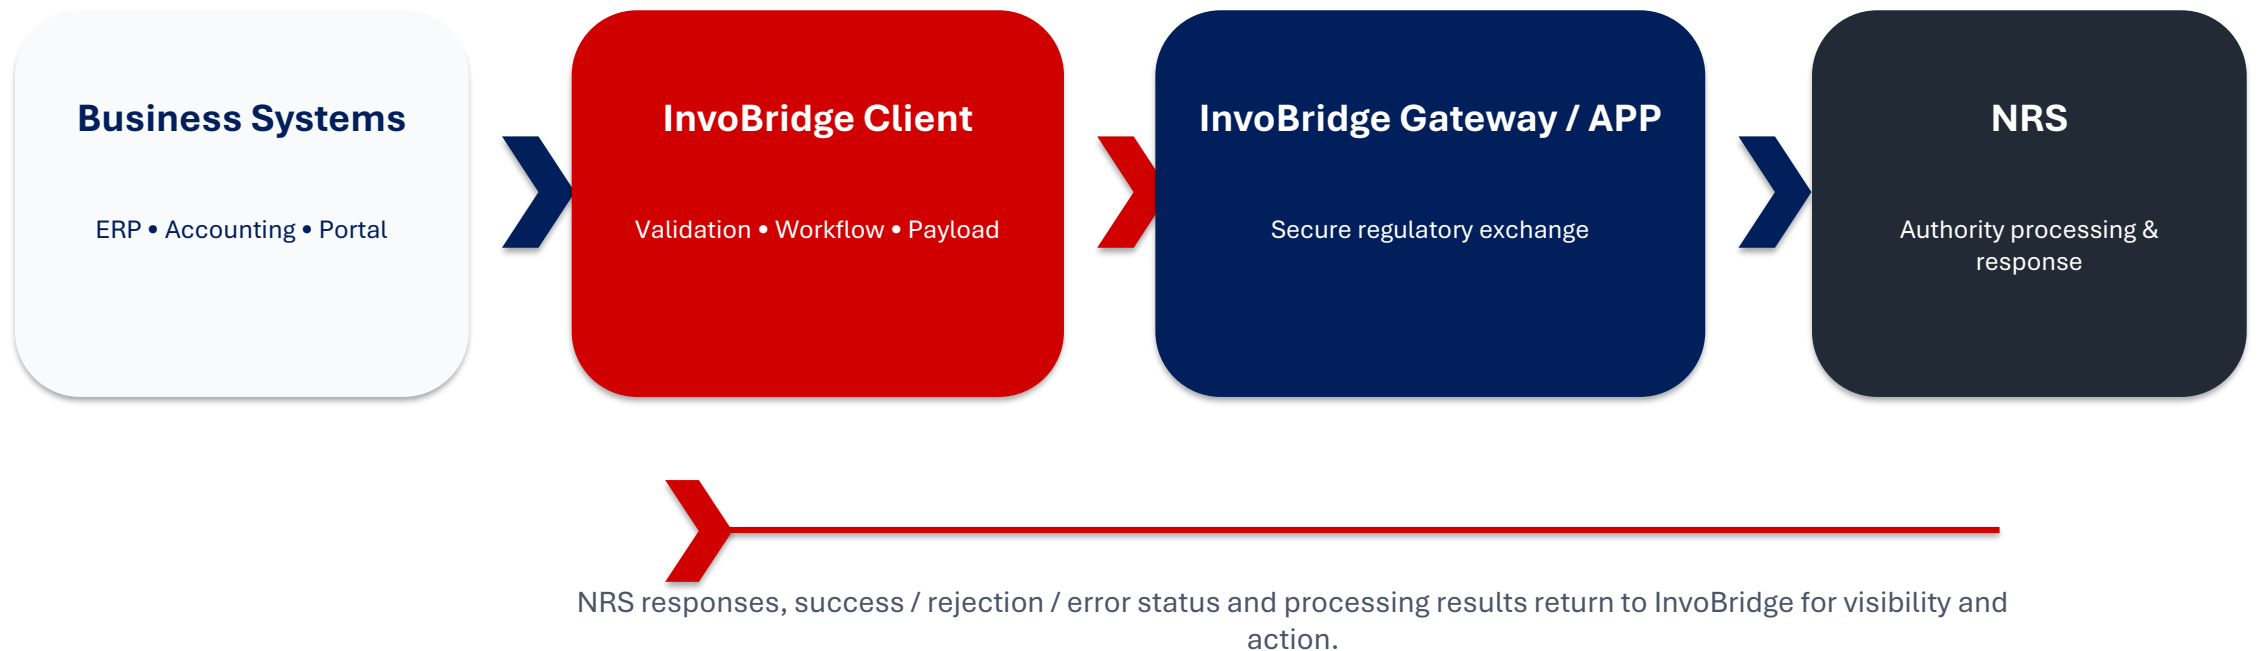

After approval, InvoBridge performs the regulatory preparation steps consistently.

The objective is consistency: every approved invoice follows the same compliance preparation process.

Secure exchange with NRS through the InvoBridge Gateway

The Gateway / Access Point Provider (APP) layer manages onward regulatory communication while the business remains focused on its invoice process.

Know what happened to every invoice

Operational teams can see what is queued, sent, completed, rejected or requires attention.

Queued

Waiting for processing

Sent

Submitted for authority processing

Completed

Successfully processed

Rejected

Requires correction

Retry

Reprocess after error

Exception Review

See error information and identify invoices that need correction or follow-up.

Retry & Reprocessing

Correct failed transactions and move them back through the processing flow.

Operational Logs

Use processing logs and status history to understand what happened and when.

Built for ongoing compliance operations — not just submission

The platform supports the activities finance, tax, operations and audit teams need after an invoice is issued.

AUDIT TRAIL

Application and invoice processing logs, workflow history, transaction status and approval records support traceability.

PAYMENT UPDATES

Track or transmit payment status updates through uploads, APIs or internal transaction flows.

REPORTING

Dashboards and reports provide visibility of invoice status, outcomes, exceptions and operational KPIs.

RECONCILIATION

Use statuses, responses and processing history to support finance and tax reconciliation activities.

A complete compliance record remains available beyond the point of submission.

NRS requirement coverage at a glance

A consolidated view of the main requirement areas addressed by InvoBridge.

 Invoice data capture Native screens, ERP/API, Excel and file channels	 Payload generation Internal invoice data transformed into required NRS structure
 Validation Configurable completeness and business-rule checks	 Secure dispatch Approved invoices sent through Gateway / APP route
 Approval Review and final approval before dispatch	 Response handling NRS responses captured and invoice status updated
 IRN / reference Reference information generated and managed in the lifecycle	 Monitoring & retry Dashboards, error review, retry and reprocessing
 QR code QR data and images generated and retained	 Audit, payment & reporting Logs, workflow history, payment updates and reporting

What the business gains

Compliance becomes part of the normal invoice process rather than a separate manual activity.

Lower compliance risk

Validate and control invoices before regulatory submission.

Faster operations

Automate repetitive preparation, submission and response-handling activities.

Better visibility

See invoice status and exceptions without chasing multiple systems or teams.

Stronger governance

Maintain approvals, logs and processing history for audit and accountability.

Flexible adoption

Start with uploads or native invoicing and move progressively to full integration.

Scalable foundation

Support multiple systems, entities and higher transaction volumes through one compliance platform.

InvoBridge bridges business invoicing and tax-authority compliance without forcing the organisation into a single invoice source or operating model.

A practical path to deployment

Start with the current invoicing landscape, select the right integration approach, configure business controls, test the end-to-end journey and move into monitored production.

1

Assess

Invoice sources, process, controls and data

2

Configure

Integration, validation and approval rules

3

Test

End-to-end invoice and response scenarios

4

Operate

Go-live, monitoring, support and reporting

InvoBridge — from invoice creation to compliance confirmation.
